4538. MEASUREMENT OF FLAME TEMPERATURE BY MEANS OF PHOTOELECTRIC SPECTROMETRY. Kamdyba, V.V. (Izvestiya Akad. Nauk, S.S.S.R. (Rep. Acad. Sci., U.S.S.R.), July-Aug. 1948, vol. 12, (4), 387-391). The intensity of Na resonance radiation emitted from flames containing between 0.16×10^{-3} and 0.37×10^{-3} gm. Na per litre of gas-air mixture was investigated. The flame temp. was kept constant at $1,800^{\circ}\text{C}$. and the thickness of the flame varied between 7 and 170 m.m. A monochromator with a variable slit-width was used to select a narrow spectral band from the emitted radiation and the intensity of this spectral band was measured photo-electrically. For slit-widths < 0.2 m.m. saturated radiation was obtained from flames 30-40 m.m. thick; for slit-widths > 0.5 m.m. saturation did not occur at thicknesses < 170 m.m. This effect of slit-width is attributed to the fact that the emitter concentration required for saturation increases with the width of spectral band examined. A similar method using an optical filter in place of a monochromator was tested and found unsatisfactory; the defect of this method is believed to be the relatively wide spectral band transmitted by optical filters. S.A.

Title : The emissivity of spectral lines of metal vapors in a flame

Periodical : Izv. AN SSSR. Ser. fiz. 18/2, page 256, Mar-Apr 1954

Abstract : The author investigated the congruence between the intensity of the central section of a spectral line, emitted by metal vapors in a flame at greater concentrations of the latter, and the radiation intensity of a black body. It was established that at greater concentrations of emitting atoms the intensity of the central section of the spectral line reaches a certain saturation where both components of the doublet have uniform intensity, i. e., the emission intensity is practically uniform to the emission intensity of a black body.

Abstract: Description of the optical scheme, design and principle of operation of the objective spectropyrometric unit SPK-1 built at the Khar'kov State Institute of Measures and Measuring Instruments for metrological work on calibration of standard and sample measures of luminosity and coloration temperatures (temperature lamps). The unit operates according to the modulation measuring method. The investigations carried out have shown that accuracy of temperature measurement attainable by means of the SPK-1 unit is of 0.03° at the "gold point" which exceeds by more than 10 times the accuracy of standard optical

EOP-51M and OP-40M Pyrometers for Measuring Temperatures
Up to 6000°.

Orig Pub : Izmerit. tekhnika, 1956, No 5, 52-54

Abstract : The apparatus described have been developed at the Khar'kov
State Institute of Measures and Measuring Instruments, on
the basis of the OP-48 and EOP-51 pyrometers. The glass
absorbers of both pyrometers, which are required to make
possible an expansion of the scale up to 6000°, were made,
of a larger diameter, from PS-2 glass 4.71 mm thick and
were mounted on the objective of the apparatus in lieu of
being set in front of the pyrometric bulb; their pyrome-
tric attenuation is of about $430 \cdot 10^{-6}$ degree⁻¹.

Calibration of the EOP-51M pyrometer, in the temperature range of 900-2500°, was done by comparison with the standard pyrometer of VNIM. At higher temperatures the scale of the apparatus was graduated on the basis of calculations. The procedure is considered for determining the magnitude of pyrometric attenuation of a glass absorber.

Title: Standard Optical Pyrometers

Original

Periodical: Zavod. laboratoriya, 1956, No 1, 116-118

Abstract: Description of a standard pyrometer EOP-51 with an accuracy of measurement of temperature at the "gold point" of approximately 0.5°, i.e., on the order of 0.05%, and with a measurement range from 750 to 4,000 - 6,000 - 10,000°, modelled after the pyrometer with a "vanishing" filament. The use of bulbs with flat filament made it possible to make the instrument of high light intensity (1:3) and with high magnification. The optics of the instrument make it possible to sight objects measuring up to 0.5 mm. The optical diagram and the construction of the instrument are given.

PERIODICAL: V sb.: Issled. po zharoprochn. splavam. Vol 2. Moscow, AN SSSR, 1957, pp 318-319

ABSTRACT: A description is presented of the principle of operation of the SPK-1 standard spectropyrometer for the measurement of brightness temperatures by the null-modulation method. The device provides a more than ten-fold increase in the accuracy of measurement of high temperatures. Its special feature is high sensitivity and the ability to make a highly precise determination of effective wave length in the 4500-8500 angstrom region of the spectrum. Employment of a monochromator prism in this device permits its use as a spectropyrometer. All measurements can be made by a single person. The apparatus makes it possible to calibrate temperature tubes for brightness and color temperatures up to 2500°C with an error $\leq \pm 10^\circ$.

TITLE: A Device for Measuring the Flame Temperature²¹ by the Intensity of Spectral Lines

PERIODICAL: Tr. Komis. po pirometrii pri Vses. n.-i. in-te metrol., 1958,
No. 1, pp. 69-76

TEXT: An installation has been developed at KhGIMIP for measuring the temperature of flames, in particular, the flame of a gas turbine engine with a photoelectric photometer having a high threshold sensitivity thus the intensity of the "D" spectral line of sodium can be measured. To obtain a "saturation" that is the black radiation in the spectral range of 0.1-0.2 μ at temperatures of $\sim 2,000^\circ\text{K}$, an addition of sodium to the flame of $\sim 10^{13}$ - 10^{14} sodium atoms per 1 cm^3 to the flame is sufficient. This addition has practically no influence on the behavior of the flame. A concave longfocal diffraction grating is used in the installation. The mean square error of measuring a temperature of $\sim 2,000^\circ\text{K}$

Card 1/2

. A Device for Measuring the Flame Temperature by the Intensity of Spectral Lines

is 1%. The Fabri-Pero (Fabrie-Perau?) standard can serve as a basis for a portable device measuring the temperature of a technical flame with a low background level. The optical circuit of the device consists of a condenser, color filter, lens with a stop, cutting out the central part of the interference pattern which enters the cathode of the photomultiplier of the photometer. A new optical system for measuring the flame temperature using a sodium resonance lamp is also proposed. The lamp has a special extension where sodium is placed. By regulating the temperature of the extension, the intensity of the resonant radiation is controlled. The calibrating curve of the lamp can be built either by using the Plank law or experimentally by the calibrated temperature lamp "AT-3" (LT-3). 4

TITLE: Extension of the Scale of the EOP-51M Pyrometer to 6,000 and 10,000°C

PERIODICAL: Tr. Vses. n.-i. in-ta metrol., 1958, Nr 35 (95), pp 60-69

ABSTRACT: Using the already described method (RZhKhim, 1957, Nr 10, 34820) the scale of the EOP-51M pyrometer has been extended to 6,000 and 10,000°C. The corresponding absorbers were prepared from purple glass of PS-2 type. The values of the pyrometric weakening of the absorbers have been measured and the errors of these measurements have been determined.

TITLE:

Comprehensive metrological studies for developing methods and apparatus for exact measurements of high temperatures

PERIODICAL:

Izmeritel'naya tekhnika, no. 1, 1961, 22-25

TEXT: The ever-increasing demands made by industry on the accuracy and range of measurements of high temperatures make it necessary to reorganize the entire metrological system in the field of measurements of high temperatures and the development of new standard and model devices on the basis of the latest achievements in the construction of precision instruments. In this connection, the VNIIM imeni D. I. Mendeleyeva and KHGIMIP developed a program for the performance of comprehensive metrological studies for the establishment of new standards and high-precision master instruments for temperatures of up to 10,000°C. This metrological research work was completed in 1960. The studies were made in four fundamental directions: thermometry

Card 1/2

Comprehensive metrological ...

S/115/61/000/001/003/007
B129/B201

of gases, thermoelectric pyrometry, optical visual pyrometry, objective pyrometry (photoelectric and radiation pyrometry). New temperature scales in the field of high temperatures were established on the basis of new methods of objective spectropyrometry. The optical pyrometers used for measuring high temperatures are not sufficiently accurate. Thus, the admissible error in measurement of the optical pyrometers OMIP (CPPIR) is up to $\pm 15^{\circ}\text{C}$ at $1,000^{\circ}\text{C}$, and up to 30°C at $2,000^{\circ}\text{C}$. It is evident that this is insufficient for many purposes and for scientific research work. In connection with the above problem, i.e., direct temperature measurement of high accuracy, the optical precision pyrometers 30П-51 (EOP-51) and ОП-48 (OP-48) spectropyrometers of the types ИКП-57 (IKP-57) and СПК (SPK), and new optical devices of the type УРП (URP) were developed and introduced. The international temperature scale was used with maximum accuracy for the new instruments at the Vsesoyuznyy nauchno-issledovatel'skiy institut metrologii im. O. I. Mendeleyeva (All-Union Scientific Research Institute of Metrology imeni D. I. Mendeleyev) and at the institutes of the Komitet standartov, mer i izmeritel'nykh priborov (Committee on Standards, Measures, and Measuring Instruments). The new pyrometers are widely used for scientific research work. There are 59 references: 49 Soviet-bloc and 6 non-Soviet-bloc.

TITLE: Enthalpy and Specific Heat of Molybdenum in the Temperature Range 1200 to 2500°K

PERIODICAL: Fizika metallov i metallovedeniye, 1961, Vol.11, No.4, pp.628-629

TEXT: In this work the authors describe their determination with an error of under 1% of the enthalpy of molybdenum at 1154 to 2462°K. Published data (Ref.1-3) on this are scanty and mostly limited to top temperatures of 1400°K. The mixing method was applied using the high-temperature vacuum installation which has already been described by some of the authors (Ref.4,5). Temperature was measured with the type ОП-48 (OP-48) optical pyrometer described by Kandyba (Ref.6). The specimen, 0.2 mm thick molybdenum foil with 0.02% impurities made by the Moskovskiy zavod tverdykh splavov (Moscow Carbide Manufacturing Plant), was contained in a quartz capsule. The whole furnace-calorimeter system was filled with argon at 12 to 14 mm Hg. The temperature rise was measured with an accuracy of 0.001°C with a platinum resistance thermometer. From the experimental data the following

Card 1/2

21369

Enthalpy and Specific Heat ...

S/126/61/011/004/019/023
E111/E435

equations are obtained

$$H_T - H_{298.16} = 4.981 T + 8.795 \cdot 10^{-4} T^2 - 1460 \text{ cal/g} \cdot \text{atom} \quad (1)$$

$$C_p = 4.981 + 17.59 \cdot 10^{-4} T \text{ cal/}^\circ \text{ g} \cdot \text{atom, (1150 - 2500}^\circ \text{K)} \quad (1a)$$

The specific-heat values for 1100 to 1300°K are 1 to 2% and about 10% higher than those, respectively, of Kelley (Ref.2) and of Redfield and others (Ref.1). There are 2 tables and 7 references: 3 Soviet and 4 non-Soviet.

TITLE: Sources of radiation for constructing a temperature scale in excess of 10000°C

SOURCE: USSR. Komitet standartov, mer'i izmeritel'nykh priborov. Trudy institutov Komiteta. no.63(123). Moscow, 1962. Issledovaniya v oblasti teplovykh i temperaturnykh izmereniy. 165-167

TEXT: High temperature sources of radiation are classified. The intrinsic disadvantages are pointed out, which are due to the presence of high level of noise from amplification, of the impulse, continuous spectrum plasma source type $\Xi B-39$ (EV-39), with an impulse duration of 150 to 400 μ sec, (this symposium - pp 162-164) if used in spectro-pyrometric set-up which compare the brightness of high temperature sources calibrated against a standard lamp. As an alternative, a wall stabilized super-atmospheric constricted arc plasma gun of approximately 15000°C is preferred. Plasma guns are temperature calibrated from the intensity of their spectral lines and, by introducing easily

Card 1/2

Sources of radiation ...

S/589/62/000/063/014/021
E202/E492

dissociating elements, temperature may be measured from the intensity of the principle resonance line of the resulting line spectrum. The calibrated plasma gun could then be used to calibrate other high temperature sources, including impulse sources, and in this way constricted arc plasmas may be used as intermediate sources in the construction of temperature scale up to 40000°C. Other high temperature sources mentioned are: the highly pressurized positive crater of the graphite arc, sublimating graphite, which is a very promising channel arc, close to the black body and reaching 55000°C; exploding wires giving continuous spectrum reaching up to 20000°C but of short duration. ✓

TITLE: Method of measuring high temperatures of flames, gas streams, and plasma by determining the intensities of spectral lines

SOURCE: Teplofizika vy*sokikh temperatur, v. 1, no. 3, 1963, 431-436

TOPIC TAGS: plasma, plasma temperature measurement, flame temperature measurement, low temperature dense plasma, spectral line intensity method, spectral line inversion method, high resolution spectrograph

ABSTRACT: The purpose of the research was to ascertain whether methods used to measure flame temperatures can be used to measure the temperature of a low-temperature dense plasma. The plasma employed consisted of fuel combustion products, air and an additional element in the form of a mixture of neutral and ionized atoms. The

Card 1/4

ACCESSION NR: AP4017722

presence of spectral lines of additional elements makes possible, for temperature measurement by the method of inversion of the spectral lines, or by the method of intensity of the saturated center of the spectral line. The former has a limitation in that the comparison source must be at least as hot as the tested plasma. The latter has been used in this experiment and the apparatus and procedure are described. Its accuracy is on the order of 1.5% and the maximum temperature depends on the element to which the apparatus is tuned. When working with the resonant line of sodium, the range is 2000--6000°, but when working with the H α line the upper limit rises to 20,000C. The apparatus can also be used as a high-speed spectrograph of high resolution. Work on the construction of the instrument was with participation of A. A. Varchenko, G. A. Boberskiy, G. L. Iosel'son, A. P. Kirichenko, V. T. Goloborod'ko, and L. A. Kostenko. Orig. art. has: 4 figures.

TITLE: Beta-stability of heavy elements

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya fizicheskaya,
v. 27, no. 1, 1963, 132-136

TEXT: This paper aims to show that the overall beta-decay time, τ_{β^-} , varies regularly within limited regions of a nuclear system. Heavy nuclei ($Z > 87$, $N > 133$) with about the same deformation are the examples. Except for very low ($Z - Z_{\beta^-}$), $\log \tau_{\beta^-}$ for a nucleus (A, Z) decreases roughly linearly with increasing $\log(Z - Z_{\beta^-})$. Z_{β^-} is the atomic number of a fictitious isobaric nucleus (A, Z_{β^-}) which is at the energy threshold of beta-decay where $Q_{\beta^-} = 0$. A similar law was also found for electron capture. These results can be explained if the following is assumed: (1) the major contribution comes from a (or a few) transition to the ground or a slightly excited level of the final nucleus, having (among

Card 1/2

Beta-stability of heavy ...

S/048/63/027/001/041/043
B108/B180

the other single-particle levels) the lowest forbiddenness, (2) the reduced probabilities of beta transitions in the region considered vary within narrow limits. These assumptions are confirmed by comparing estimates with experimental results for nuclei of all four types of parity. This paper was read at the 12. Annual Conference on Nuclear Spectroscopy, Leningrad, January 26 - February 2, 1962. There are 3 figures. The most important English-language references are:

TITLE: The Feeding of Cold, Chemically Purified Water into the
Condensers of Turbines (Podacha kholodnoy khimicheski
ochishchennoy vody v kondensatory turbin)

PERIODICAL: Energetik, 1958, Nr 11, pp 18-19 (USSR)

ABSTRACT: The authors state that at one of the TETs, a system has
been put into practice for feeding cold, chemically purified
water into the condensers of AP-25-1 and AP-25-2 type turbines.
Water from the chemical water purifier (sodium cationization)
is fed at a temperature of 10-14° C into the steam chamber
of the condensers through a sprinkling device consisting of
a pipe, having an internal diameter of 76 mm and a length of
4 m. The water flows out of the perforations of the
sprinkler, cuts across the stream of worked out steam, is

Card 1/2

SOV-91-58-11-8/20

The Feeding of Cold, Chemically Purified Water into the Condensers of
Turbines

heated up, deaerated and flows down the side walls of the
condenser. Tests carried out to determine the economic
effect of the system, showed that the saving of fuel
amounted to 50-95 kg per hr.
There is one diagram and one table.

TITLE: Oxidation of phenol in an ultrasonic field and in the presence of carbon tetrachloride

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 5, 1962, 1041-1043

TEXT: In earlier papers (Zh. fiz. khimii, in print) it had been established that in an ultrasonic field, phenol slowly oxidized, the benzene ring breaking and CCl_4 being decomposed into chlorides and atomic chlorines. The present authors added small amounts of CCl_4 to intensify the oxidation of phenol. Phenol solutions (25 mg/l) in acid (H_2SO_4), neutral (buffer solution), or alkaline (NaOH) media, to which CCl_4 had been added in the proportion of 0.1 ml per 400 ml of solution, were treated with ultrasonic waves of 800 kc/sec frequency at a rate of 4 w/cm². Thereupon the total content of phenol and chlorine phenols was colorimetrically determined with 4-aminoantipyrine, and the phenol content

Card 1/2

Oxidation of phenol in an ...

S/076/62/036/005/008/013
B101/B110

of phenol was measured with diazotized p-nitroaniline. After an ultrasonic treatment of 10 min, the solution contained 1.94 mg/l of phenol and 7.76 mg/l of chlorine phenols (referred to phenol) at pH = 3. The respective values were 4.70 and 5.20 at pH = 7, 6.47 and 3.58 at pH = 9.5, and 9.90 and 2.70 at pH = 12. The concentration of chlorine phenols reached a maximum after an ultrasonic treatment of 3-5 min, and then decreased owing to the oxidation of the chlorine phenols to maleic acid. As the rate of oxidation decreased with decreasing concentration of phenol, the oxidation of the first 60% of phenol took 10 min at pH = 3 whereas oxidation of the remainder required 20 min. The oxidation of 25 mg/l of phenol was complete after 30 min. The process of oxidation took only 15 min when the concentration of CCl_4 was raised to 0.2 ml per 400 ml of solution, part of the CCl_4 not being dispersed. If no CCl_4 is added, the oxidation takes 2.5 hrs under otherwise equal conditions. There are 1 figure and 1 table.

AUTHORS: Lur'ye, Yu. Yu., Kandzas, P. F., Nekina, A. A. (Moscow)

TITLE: Decomposition of carbon tetrachloride in a field of ultrasonic waves

PERIODICAL: Zhurnal fizicheskoy khimii, v. 37, no. 1, 1963, 13-17

TEXT: This paper is part of a study on the ultrasonic purification of industrial waste waters. A piezoquartz transducer was used at 800 kc/sec and 19 - 21°C. Preliminary experiments with 0.1 N HCl and 600 mg/l NaCl showed that the chlorides do not oxidize and the reaction $2 \text{HCl} + [\text{O}] \rightarrow \text{Cl}_2 + \text{H}_2\text{O}$ mentioned by E. W. Florsdorf and L. A. Chambers (J. Amer. Chem. Soc., 55, 3051, 1933) does not take place. The decomposition products of CCl_4 were found to be chlorine, chlorides, and hypochlorites.. From the results obtained by analyzing the decomposition products, the reaction $\text{CCl}_4 + \text{H}_2\text{O} \rightarrow 2 \text{Cl} + 2\text{HCl} + \text{CO}$ was confirmed for the decomposition of CCl_4 in an aqueous medium under the action of ultrasonic

Card 1/2

Decomposition of carbon tetrachloride in ... S/076/63/037/001/002/029
B101/B186

waves. Furthermore, the pH of the medium was found to have no decisive effect on this process. At a CCl_4 concentration of 44 - 336 mg/l the portion of decomposed CCl_4 is 61 - 63%, and does not depend on the concentration. Higher concentrations retard the decomposition. An increase in intensity from 1 w/cm^2 to 4 w/cm^2 increases the portion of decomposed CCl_4 from 12.8 to 63.4%, but beyond 6 w/cm^2 increases the decomposition rate no longer. The main amount of CCl_4 decomposes within the first 15 - 20 min. Ultrasonic irradiation over a longer period decreases the rate of decomposition. Approximately 50% of CCl_4 is removed from the solution by ultrasonic irradiation. There are 5 tables.

TITLE: A method of producing a mixture of neon and helium when recti-
fying air

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 5, 1962, 408, abstract
5K105 (Zakłady Azotowe im. Pawła Findera. Polish patent
44598, May 24, 1961)

TEXT: A method of obtaining a mixture of neon and helium from an air
separation apparatus has been patented; the feature of the method is the
use of a condensation-evaporation column. Gas from beneath the cover of
the condenser 1 in the double rectification air separation apparatus 2
flows down the line 3 into the condensation-evaporation column 4; the
pressure in this column is slightly higher than in the upper column of the
apparatus 2. The N₂ is liquefied in the tubes of the condenser 5 and flows
into the vat 4 containing the spiral tube 6. Liquid N₂ is fed into the

Card 1/2

A method of producing ...

S/081/62/000/005/060/112
B156/B108

space between the tubes in 5 from the pockets of the condenser 1, this N_2 boiling at a pressure of 0.5 at. in 5, the pressure maintained by the vacuum pump 7: owing to the reduced boiling point of the N_2 , a higher degree of condensation of N_2 is reached in the tubes of 5, and the undensified gas is enriched with Ne and He. A small amount of liquid N_2 is fed into 6 through the line 8; the heat delivered from the N_2 assists in evaporating the Ne and He from the liquid N_2 in the vat of the column 4. From this vat the liquid N_2 flows through the line 9 spraying the upper column of the apparatus 2. The mixture of neon and helium, also containing N_2 , is taken off through the line 10 for further processing. The indicators 11 and 12 maintain the level of liquid in 4, and are used for controlling the operation of 4. With the proposed method, extraction of Ne and He from air is high. [Abstracter's note: Complete translation.] There is 1 figure.

PURPOSE: This reference book may be used in scientific-research and experimental-design work in institutes, design offices, and schools of higher education, as well as for training specialists in chemical thermodynamics and thermal physics.

COVERAGE: Volume 1 of this work deals with methods for calculating thermodynamic properties and with the selection of constants required for the calculations. Volume 2 contains tables of thermodynamic properties (reduced thermodynamic potential, entropy, enthalpy, and the logarithm of the dissociation or ionisation constants of equilibrium) compiled where data were lacking on the basis of published and unpublished material from a number of Soviet research institutes. Thermodynamic properties for the ideal gas

state are presented in table form for 335 gases, 44 liquids, and 45 solids compounded from 33 chemical elements and their isotopes, viz.: H, D, T, He, Li, Be, B, C, N, O, F, Ne, Na, Mg, Al, Si, P, S, Cl, Ar, K, Ca, Br, Kr, Rb, Sr, Zr, I, Xe, Cs, Ba, Hg, and Pb. Thermodynamic properties are given for the following 22 gases in the range from room temperature to 20,000°K: H_2 , H_2^+ , H^+ , O, O^+ , N_2 , Cl_2 , Ca , OH , OH^+ , H_2O , N, N^+ , Na, Na^+ , NO, NO^+ , C, C^+ , CO, CO^+ , and e^- ; for the 14 least stable gases up to 4000°K; and for the remaining 299 gases up to 6000°K. Virial coefficients for 34 gases are also given up to 6000°K.

TITLE: The kinetics of the thermal decomposition of solids

CITED SOURCE: Sb. tr. Gos. in-ta prikl. khimii, vy'p. 48, 1962, 170-182

TOPIC TAGS: kinetics, thermal decomposition, solid state decomposition, activation energy, inorganic crystal

TRANSLATION: It has been shown that the Yerofeyev equation which is used in practice does not correctly describe the process of thermal degradation of inorganic crystals since it holds only for a reaction in a continuous medium with formation of a nucleus in the volume. During the thermal decomposition of crystals, nuclei are formed only on the surface. A solution was obtained to the problem of calculating the probability of a reaction at a given point in the body for the general case with a body of any shape and an arbitrary law for the formation of nuclei not only on the surface, but also throughout the volume of the body. The exact solution obtained is analyzed for two limiting cases. It is shown that the

Card 1/2

ACCESSION NR: AR4025721

total energy of activation depends not only on the nature of the compound but also on the dimensions and shape of the particles. By means of the similitude theory, two dimensionless variables are found which define the process of thermal decomposition Authors' summary.

Title : Factory test of a cast-iron crankshaft in the
6-DR-30/50 Diesel

Periodical : Energ. byul., no.4, 10-14, Ap 1955

Abstract : The authors present results of a 1,000 hour test of a specially-made cast-iron crankshaft for the 6-DR-30/50, 6 cylinder, 300 mm bore, 500 mm stroke, 600 HP, 300 rpm engine under various conditions to determine the strength and wearability of this type of crankshaft in comparison with the regular steel crankshaft. The performance was found satisfactory, and now the cast-iron crankshafts of this type are being given a final test on ships at sea. Five diagrams and 9 tables.

Title : Oil cooler for the D and DR-30/50 engines

Periodical: Energ. byul., no.5, 9-13, My 1955

Abstract : The author describes the water-cooled oil coolers now in mass production designed by Ye. A. Agafonov, Kandidat of Technical Science, for the D and DR-30/50 type 4, 6 cylinder engines. The oil coolers' construction is illustrated with 6 drawings. Two tables contain figures derived from a 2.000-hour test of the coolers.

TITLE: Modernised engine of the series DR 30/50 (Modernizirovannyi dvigatel serii DR 30/50)

PERIODICAL: "Energomashinostroenie", (Power Machinery Construction), 1957, No. 3, p. 21, (U.S.S.R.)

ABSTRACT: The Russkiy Dizel Works have designed and are manufacturing the modernised engine 8 DR 30/50, in which all the fundamental inadequacies of the earlier manufactured engines, type D and DR 30/50, were eliminated. For instance, the cylinders are oil-cooled; thereby the temperature of the cylinder bottoms decreased from 630 to 400 °C. A few other modifications are also mentioned. The engine has passed its reception tests by the State Commission and has been highly recommended for series manufacture.

TITLE: Muffling the Intake Noise of the 6D-30/50 Engine (Opyt glusheniya shuma vsasyvaniya dvigatelya 6D-30/50)

PERIODICAL: Energeticheskiy byulleten', 1958, Nr 3, pp 30-33 (USSR)

ABSTRACT: The noise level 0.5 m from the intake of the engine is 114-115 decibels. In an effort to decrease this noise, experiments have been carried out with intake mufflers, consisting of two consecutive chambers connected by tube-like channels. The tested muffler was fitted inside and outside the engine casing and also on a 6TN-29/50 engine of 600 hp (i.e. twice as powerful as the 6D-30/50). The noise level 0.5 m from the engine was measured with a Sh-52 noise gage and the frequency with a Dewey 1401C analyzer. The muffler decreased the noise level of the air pump by 11 decibels and the engine noise by 2-3 decibels. Used with the 600 hp engine the noise level is only 2-3 decibels higher. The frequency spectrum remains constant. The noise of the engine is analyzed into its component parts and further methods of decreasing noise and vibration are mentioned.

Translation from: Referativnyy zhurnal. Mashinostroyeniye, 1959, Nr 15, p 9 (USSR)

AUTHOR: Kane, M.Yu.

TITLE: Some Problems of Applying the Appropriate Technology in Designing Machines

PERIODICAL: Byul. tekhn.-ekon. inform. Sovnarkhoz BSSR, 1958, Nr 1, pp 17 - 19

ABSTRACT: The fact that designers are underrating the importance of technological problems is the reason that machines are manufactured not according to the expedient technology and therefore at too high costs. A close co-operation of technologists and designers in working out the designs permits to reduce the time of acquiring the necessary experience, makes manufacturing less labor-consuming and, consequently, reduces the cost price of the article. In some plants the drawings of new machinery are not corroborated for manufacture so as to warrant the appropriate technology of design. The experience of the work of the Office for the

Some Problems of Applying the Appropriate Technology in Designing Machines

Application of the Expedient Technology of the Moscow "Orgstankinprom" Institute confirms the possibility of reducing the labor-consuming methods in machine tool manufacture by 15 - 25 % only on account of an improved technology of the design. The basic requirements of an appropriate technology in the design of machines and machine parts are enumerated.

USSR/ Chemistry - Spectral analysis

Card 1/1 Pub. 43 - 81/97

Authors : Kane, S. I., and Kler, M. M.

Title : Quantitative spectral analysis during manufacture of normal electro-corundum

Periodical : Izv. AN SSSR. Ser. fiz. 18/2, 292-293, Mar-Apr 1954

Abstract : A method was developed for direct determination of SiO_2 , Fe_2O_3 , CaO and MgO admixtures in bar samples of electro-corundum. The content of the main component - Al_2O_3 (75 - 90%) - is determined by the percentage difference of the remaining admixtures. The method was tested by one of the Abrasives Factories with satisfactory results.
